

SENSORY UPDATE

WHAT DOES IT DO?

Sensory Update is used to get the latest version of Sensory Software programs installed on your computer.

Sensory Update will get the latest version of **all** Sensory Software titles installed. You cannot select which programs will be updated.

Sensory Update will not upgrade between major releases. For example, if you have The Grid 1 installed it will not upgrade to The Grid 2; it will upgrade to the latest version of The Grid 1.

DO I NEED TO USE SENSORY UPDATE?

You should use Sensory Update if you have a problem with a Sensory Software program and you want the latest version of the software. You can also use Sensory Update if there is a new feature available that you wish to download.

HOW DOES IT WORK?

When you start the updater it connects to the sensory update site and checks for suitable updates. If any Sensory Software programs are out of date it will download the latest updates and install them. The process is completely automatic. You will need a working internet connection.

To start the update process **Start → All Programs → Sensory Software → Utilities → Sensory Update**. Follow the onscreen prompts.

DOES THE UPDATER NEED A CONNECTION TO THE INTERNET?

Yes.

DO I NEED A BROADBAND CONNECTION?

No, but it may take a long time on a dial up connection. The size of the downloads will vary depending on what is installed and when it was last updated. The updater tries to avoid downloading files unless its essential that they are required.

CAN ALL USERS UPDATE THE SOFTWARE?

The updater needs to be able to install new program components. If you need a system administrator to install a program, you will need to be an administrator to run the updater.
